3.1 Migration from gf180

The `gf180` package has been deprecated in favor of `gf180mcu`. This guide will help you migrate your code from `gf180` to `gf180mcu`.

3.1.1 Why the change?

The name change from `gf180` to `gf180mcu` was made to better align with GlobalFoundries' naming conventions for their 180nm MCU process technology. The functionality remains identical, but the package name better reflects the specific process being targeted.

3.1.2 Migration steps

1. Update your dependencies

Replace `gf180` with `gf180mcu` in your project dependencies:

```
# If using pip
pip install gf180mcu # Instead of gf180

# If using uv
uv pip install gf180mcu # Instead of gf180

# If using poetry
poetry add gf180mcu # Instead of gf180
```

In your `requirements.txt` or `pyproject.toml`, replace `gf180` with `gf180mcu`.

2. Update your imports

Simply replace all imports of `gf180` with `gf180mcu`:

```
# Old code
import gf180
from gf180 import some_component

# New code
import gf180mcu
from gf180mcu import some_component
```

3. Update function calls and references

Replace all references to `gf180` with `gf180mcu`:

```
# Old code
component = gf180.diode_dw2ps()
gf180.PDK.activate()

# New code
component = gf180mcu.diode_dw2ps()
gf180mcu.PDK.activate()
```

3.1.3 Compatibility period

The `gf180` package will continue to work as a thin wrapper around `gf180mcu` for a transition period, but it will show deprecation warnings. The package will eventually be removed, so we recommend migrating to `gf180mcu` as soon as possible.

3.1.4 Getting help

If you encounter any issues during migration, please [open an issue on GitHub](#).
